

Pusdatin AI Agents

Public Health Intelligence — Jakarta-powered, globally minded.

AN AUTONOMOUS MULTI-AGENT WORKFLOW

From fragmented public health data to actionable citizen services — in one auditable pipeline.

THE PROBLEM

Public health workflows are slow, manual, and risky.

01

Fragmented intake

Records arrive from many channels with inconsistent formats and schemas.

02

Manual quality checks

Validation and cleaning are still done by hand, slowing every downstream step.

03

Late privacy gates

PII redaction often happens after exposure, creating compliance risk.

04

Slow service signals

Insights reach local citizen-service teams too late to act on.

THE SOLUTION

Five autonomous agents, one auditable pipeline.

Privacy by default • Audit trail at every step • Schema adapters for global scale

Deterministic orchestration, structured artifacts, human escalation.

Sources

CSV • APIs • Forms • Batch

Agents

Ingest → Quality → Privacy → Insight → Service

Storage

Restricted raw • Redacted analytics

Outputs

Service actions • Audit logs • Metrics

TRUST & SAFETY

- **Privacy by default**

Mandatory redaction before any downstream use.

- **Rule-based quality**

Checks happen before any recommendation.

- **Human-in-the-loop**

Escalation path for high-risk cases.

- **Audit-friendly**

Structured outputs at every step.

OUTCOMES

Faster, safer, more actionable public health operations.

5x

faster data-to-action cycle

vs. manual triage

100%

redaction coverage

by design, not by review

1

auditable trail

per record, per agent step

WHY IT MATTERS

Better data quality and trust • privacy-by-design processing • actionable, real-time recommendations for local citizen-service teams • a portable architecture that starts in Jakarta and scales globally.

From raw record to citizen service action.

ROADMAP

From hackathon prototype to multi-city deployment.

THANK YOU

Public health, rebuilt as agents.
